

Retrofit for Maschine type W+D 627

2nd Window Patching Section

Short Description

Installation of a second window patching section.

Description of the Measure

The installation makes it possible to produce envelopes with 2 windows and separate window material cuts. The size of the window film is adjusted according to the window. All window cut-outs are done in the window cutting section.

Machine Requirements

The window material can be fed using a single unwind unit or a W+D 190 fully automatic reel splicer.

- / The single unwind unit is placed above the machine. A sensor monitors the end of the roll and switches off the machine
- / The reel splicer ensures a constant supply of material to the window patching section. The automatic change of the window material roll is done at maximum machine speed

Benefits

- / Increases the machine's product variety
- / Achieves savings thanks to the use of two separate film rolls
- / Makes it possible to use different (e.g. colored) film types in envelopes

Second window material section
